The information context of the modern organization is rapidly evolving in the face of intense global competition. Information technologies, including databases, new telecommunications systems, and software for synthesizing information, make a vast array of information available to an ever expanding number of organizational members. Management's exclusive control over knowledge is steadily declining, in part because of the downsizing of organizations and the decline of the number of layers in an organizational hierarchy. These trends, as well as issues surrounding the Web 2.0 and social networking, mean that it is increasingly important that we understand how informal

knowledge networks impact the generation, capturing, storing, dissemination, and application of knowledge. This innovative book provides a thorough analysis of knowledge networks, focusing on how relationships contribute to the creation of knowledge, its distribution within organizations, how it is diffused and transferred, and how people find it and share it collaboratively.

This book provides an introduction to Human Resource Information Systems (HRIS) for those in the public administration field. At the intersection between human resource management and information technology, HRIS is often the key to having and maintaining the personnel data that is essential for hiring and recruitment, strategic planning and analysis, and legal requirements in most public organizations. This book describes what an HRIS system is, what the functionality of such a system should be, and outlines the practical aspects of an HRIS. It also compares the different aspects of human resources in public organizations, non-profit organizations, and private corporations, and how differences across organizations may influence the

functionality requirements of the HRIS. Finally, the volume contains both an organizational theory component, which frames how an HRIS interacts with an organization both from a functional standpoint and a reporting standpoint. The book includes a practical component, which includes real-world case studies that illustrate the advantages and pitfalls to implementing an HRIS enterprise system. Providing a thorough introduction to HRIS for both academics and practitioners, this volume is appropriate for researchers, graduate students, and practitioners in the fields of public administration, higher education administration, information systems, computer science, and human resources.

Several decades of international aid, predominantly granted by the highly developed world (the haves), for the use of ICT in developing regions (known by several labels, such as the have-nots, bottom of the pyramid, the south, or, some time ago, the third world) have passed, but the holy grail of turning these societies into the ideals defined by the donors is still elusive. Previously the emphasis was on top-down approaches in this endeavour. Now priority is increasingly given to bottom-up approaches, putting the targeted communities first, using methods such as co-creation and living labs. Information and Communication Technologies for Development (ICT4D) is still a domain in search of a common ground. The many different

perspectives from diverse ideologies, paradigms and theoretical perspectives here lead to an interesting debate, but, meanwhile, agents of social change are doing their best to change communities – ostensibly for the better. An ongoing endeavour, this discussion requires further investigation of the complexities of techno-societies. The contributions to this volume range from explorations of theory, models and methods to investigations into the practical implementation of ICT in communities, covering the characteristics of social groups and different generations and gender issues, as well as its applications in education and health. As such, the contributions in this book will inform continuing debates concerning the role of ICT in developing communities on the wrong side of all the technical and social divides in human societies.
