MULTI-THREADED PROGRAMMING WITH POSIX THREADS

A standardized interface for thread implementation is POSIX Threads (Pthreads), which is a set of C-function library calls. OS vendors are free to implement the interface as desired, but the application developer should be able to use the same interface across multiple platforms.

pthread_create () gets 4 parameters. The first parameter is used by pthread_create () to supply the program with information about the thread. The second parameter is used to set some attributes for the new thread. In our case we supplied a NULL pointer to tell pthread_create () to use the default values.
