Chapter 8 - Sampling | Statistics Flashcards | Quizlet Chapter 8 Sampling And Sampling Chapter 8 Sampling. Sampling is the statistical process of selecting a subset (called a “sample”) of a population of interest for purposes of making observations and statistical inferences about that population. Social science research is generally about inferring patterns of behaviors within specific populations. We cannot study entire ...Chapter 8 Sampling | Research Methods for the Social Sciences Start studying Chapter 8 - Sampling. One of the foundational ideas in statistics is that we can make inferences about an entire population based on a relatively small sample of individuals from that population. In this chapter we will introduce the concept of statistical sampling and discuss why it works. a. The primary goal of sampling is to get a representative sample, or a small collection of units or cases from a much larger collection or population, such that the researcher can study the smaller group and produce accurate generalizations about the larger group.

2. THE POPULATION

- Consists of the totality or aggregate of the observations with which the researcher is concerned
- 3. • Population is an accessible group of people who meets a well-defined set of eligibility criteria.

Chapter 8 Sampling. In this chapter, we kick off the third segment of this book, statistical inference, by learning about sampling. The concepts behind sampling form the basis of confidence intervals and hypothesis testing, which we'll cover in Chapters 9 and 10 respectively. For sample mixing and handling, refer to API MPMS Chapter 8.3 (ASTM Practice D5854). This practice does not cover sampling of electrical insulating oils and hydraulic fluids.
