Transportation Research Board

A conceptual introduction and practical primer to the application of imagery and remote sensing data in GIS (geographic information systems).

An ArcGIS Pro Project Workbook Springer Science & Business Media

Historic resources are in some way managed by every transportation agency in the nation. Transportation agencies manage historic and prehistoric archaeological sites, buildings, structures, objects, routes, landscapes, and districts to prevent damage to such resources and to mitigate damage when it is unavoidable. In order to track known resources, transportation agencies often keep local files in a variety of forms, rely upon external sources of information (e.g., historic preservation agencies at the state level), and depend upon staff expertise gained by years of local work. Starting in 1997, Caltrans started a series of surveys of rural rights of way in its district offices. This work, which is still on-going, created fairly similar sets of digital data within approximately half of the agency's district offices. The GIS datasets and relational database management systems are roughly similar between offices, but not identical. The present study focuses on defining how the district office information systems for historic resources can (and cannot) be used to create an enterprise information management model specific to historic resources within Caltrans. Results of this study range from findings specific to Caltrans and its district offices to general findings that should apply to any transportation agency contemplating an enterprise-wide system for managing cultural resources.

This book defines and discusses how the field of Enterprise Architecture (EA) can be incorporated into the design of Enterprise Geographic Information Systems (EGIS). The objective of EA is to develop a strategic plan that structures an organization's resources (data, information, people, and assets) into one team that works together to achieve the company's objectives in an efficient, agile, and adaptable way. It demonstrates how EA concepts can be incorporated within EGIS by improving the system's efficiency and reliability. Through real-world examples and step-by-step explanations, the reader will reach a comfortable understanding of the theories and methods discussed in the book.

Nowadays 3D Geoinformation is needed for many planning and analysis tasks. For example, 3D city and infrastructure models are paving the way for complex environmental and noise analyses. 3D geological sub-surface models are needed for reservoir exploration in the oil-, gas-, and geothermal industry. Thus 3D Geoinformation brings together researchers and practitioners from different fields such as the geo-sciences, civil engineering, 3D city modeling, 3D geological and geophysical modeling, and, last but not least, computer science. The diverse challenges of 3D Geoinformation Science concern new approaches and the development of standards for above- and under-ground 3D modeling, efficient 3D data management, visualization and analysis. Finally, the integration of different 3D approaches and data models is seen as one of the most important challenges to be solved.

This "how-to" book on planning and managing GIS within local government describes and details the key components of a successful enterprise, sustainable and enduring GIS. It describes the strategic planning process an organization must undertake prior to GIS implementation. The heart of the book is the formula for success that offers a systematic methodology for examining and benchmarking a GIS initiative and the practical and repeatable strategy for success. There are many obstacles to successful GIS implementation, and unfortunately, the local government landscape is riddled with false starts, poorly planned implementations, and glorified mapping systems. This book documents the reason for failure and possible remedies to overcome the challenges to implementation. It discusses pathways to change, ways of improving organizational effectiveness and efficiency, and lays out the organizational approaches, management processes, and leadership actions that are required for GIS to become an indispensable part of an organization. This book is about aiming high, so you can consistently hit your mark by formulating goals and objectives that will tremendously influence the success of a GIS initiative. It details the factors crucial for building an enterprise GIS vision statement that includes governance, data and databases, procedures and workflow, GIS

software, GIS training and education, and infrastructure, and how to develop performance measures related to the stated objectives of an organization. The book combines theory with real-world

experience to offer guidance on the process of managing GIS implementation. Through key components, this book introduces a new way to think about GIS technology.
