This study, originally published in 1986, is directed to the period before the establishment of scientific management as a recognised movement, in an attempt to answer two basic questions: was there a body of management literature immediately preceding the emergence of scientific management? Did this literature, if it existed, have a central concept or approach which could be recognised? This title will be of interest to students of business studies and management.

This comprehensive new guide, available in two volumes, addresses Sections I through XI of the ASME Boiler and Pressure Vessel Code and Codes B31.1 and B31.3 for Pressure Piping. Contributors also provide examples and explanatory text, graphics, references, and annotated bibliographic notes. As a result, engineers can immediately refer to the material requirements to find acceptance criteria. Its indepth treatment of each of the Code sections makes this the definitive companion book to the ASME Boiler and Pressure Vessel Code. Volume 1 covers Code Sections I, II, III, IV, VI and VII, as well as Codes B31.1 and B31.3 for Piping. Volume 2 includes Sections V, VII, IX, X, and XI, as well as special topics relating to the Code. Each volume contains full introductory material, table of contents, author information, and indexes for both volumes.

This book presents the most recent advances in the research and applications of reconfigurable mechanisms and robots. It collects 93 independently reviewed papers presented at the Third ASME/IFToMM International Conference on Reconfigurable Mechanisms and Robots (ReMAR 2015) held in Beijing, China, 20-22 July 2015. The conference papers are organized into seven parts to cover the reconfiguration theory, topology, kinematics and design of reconfigurable mechanisms including reconfigurable parallel mechanisms. The most recent results on reconfigurable robots are presented including their analysis, design, simulation and control. Bio-inspired mechanisms are also explored in the challenging fields of rehabilitation and minimally invasive surgery. This book further addresses deployable mechanisms and origami-inspired mechanisms and showcases a wide range of successful applications of reconfigurable mechanisms and robots. Advances in Reconfigurable Mechanisms and Robots II should be of interest for researchers, engineers and postgraduate students in mechanical engineering, electrical engineering, computer science and mathematics.

Analysis of ASME Boiler, Pressure Vessel, and Nuclear Components in the Creep Range Second Edition The latest edition of the leading resource on elevated temperature design In the newly revised Second Edition of Analysis of ASME Boiler, Pressure Vessel, and Nuclear Components in the Creep Range, a team of distinguished engineers delivers an authoritative introduction to the principles of design at elevated temperatures. The authors draw on over 50 years of experience, explaining the methodology for accomplishing a safe and economical design for boiler and pressure vessel components operating at high temperatures. The text includes extensive references, offering the reader the opportunity to further their understanding of the subject. In this latest edition, each chapter has been updated and two brand-new chapters added—the first is Creep Analysis Using the Remaining Life Method, and the second is Requirements for Nuclear Components. Numerous examples are included to illustrate the practical application of the presented design and analysis methods. It also offers: A thorough introduction to creep-fatigue analysis of pressure vessel components using the concept of load-controlled and strain-deformation controlled limits An introduction to the creep requirements in API 579/ASME FFS-1 "Remaining Life Method" A summary of creep-fatigue analysis requirements in nuclear components Detailed procedure for designing cylindrical and spherical components of boilers and pressure vessels due to axial and external
