Recombinant DNA Technology Market Global Industry Analysis, Recombinant DNA Definition. Recombinant DNA is a form of DNA constructed in the laboratory. It is generated by transferring selected pieces of DNA from one organism to another. The vial shown in the photograph contains human insulin, one of the first therapeutic proteins that was genetically cloned. The drug is used to treat diabetes. Recombinant DNA | Summary Recombinant DNA technology combines DNA from different sources to create a different sequence of DNA. Recombinant DNA technology is used in a wide range of applications from vaccine production to the production of genetically engineered crops. As recombinant DNA technology advances, technique precision must be balanced by ethical concerns. What Is Recombinant DNA Technology? - ThoughtCo Recombinant DNA Technology A technique mainly used to change the phenotype of an organism (host) when a genetically altered vector is introduced and integrated into the genome of the organism. So, basically, this process involves the introduction of a foreign piece of DNA structure into the genome which contains our gene of interest. Recombinant DNA Technology- Tools, Process, and Applications Recombinant DNA (rDNA) molecules are DNA molecules formed by laboratory methods of genetic recombination (such as molecular cloning) that bring together genetic material from multiple sources, creating sequences that would not otherwise be found in the genome.
