This book draws on findings from psychology, neurology, and genetics, to offer a multi-dimensional analysis of criminal behavior. It explores the

biological bases of emotions such as aggression, anger, and hostility and how they-- combined with social psychological influences, such as family history and environmental conditions-- may lead to violence. Specific case studies, including serial killings, mass murders, family violence, cannibalism, and hitmen, are referenced throughout, providing real-world examples of these theories in action. Issues of free will and the law are discussed as well as suggestions for curbing violent behavior.

Unlock your children's potential by helping them build their strengths. This game-changing book shows us the extraordinary results of focusing on our children's strengths rather than always trying to correct their weaknesses. Most parents struggle with this shift because they suffer from a negativity bias, thanks to evolutionary development, giving them "strengths-blindness." By showing us how to throw the "strengths switch," Lea Waters demonstrates how we can not only help our children build resilience, optimism, and achievement but we can also help inoculate them against today's pandemic of depression and anxiety. As a strengths-based scientist for more than twenty years, ten of them spent focusing on strengths-based parenting, Waters has seen how this approach enhances self-esteem and energy in both children and teenagers. Yet more on the plus side: parents find it a particularly exciting and rewarding way to raise children. With many suggestions for specific ways to

interact with your kids, Waters demonstrates how to discover strengths and talents in our children, how to use positive emotions as a resource, how to build strong brains, and even how to deal with problem behaviors and talk about difficult situations and emotions. As revolutionary yet simple as Mindset and Grit, The Strength Switch will show parents how a small shift can yield enormous results.

We see a lot but do we observe what we see to gain insights? When we do not observe what we see, seeing something through our mental eyes becomes very remote. Insight is seeing something through our mental eyes. Definitely, this book reduces the distance between seeing things through physical and mental eyes. Most of the insights have emotions and thoughts that have day to day appeals. The readers can associate themselves with the insights and identify themselves in the situations, events, and characters presented in these insights. The readers can get insights into ten Ps. Perception, performance, perseverance, personality, perspective, persuasion, philosophy, power, psychology, and preferences. Life is intended to be insightful. Everyday experiences make one's life insightful.

Harvard University Press
Sohlberg and Mateer's landmark introductory text helped put cognitive rehabilitation on the map for a generation of clinicians, researchers, educators, and students. Now, more than a decade later, the discipline has come of age. This new volume provides a comprehensive overview of this fast-evolving field. More than a revised edition, the text reflects the dramatic impact of recent advances in neuroscience and computer technology, coupled with changes in service delivery models. The authors describe a broad range of clinical interventions for assisting persons with acquired cognitive impairments--including deficits in attention, memory, executive functions, and communication--and for managing associated emotional and behavioral issues. For each approach, theoretical underpinnings are reviewed in depth and

clinical protocols delineated. Difficult concepts are explained in a clear, straightforward fashion, with realistic case examples bringing the material to life. Also included are samples of relevant assessment instruments, rating scales, and patient handouts. Throughout, the new volume emphasizes the need to work from a community perspective, providing a framework for forming collaborative partnerships with families and caregivers. It is an essential resource for professionals across a wide variety of rehabilitation specialties, and will serve as a text in courses on rehabilitation methods and neurogenic disorders.

Cognitive Rehabilitation Penguin
Clinical psychologists and neuropsychologists are traditionally taught that cognition is mediated by the cortex and that subcortical brain regions mediate the coordination of movement. However, this argument can easily be challenged based upon the anatomic organization of the brain. The relationship between the

prefrontal cortex/frontal lobes and basal ganglia is characterized by loops from these anterior brain regions to the striatum, the globus pallidus, and the thalamus, and then back to the frontal cortex. There is also a cerebrocerebellar system defined by projections from the cerebral cortex to the pontine nuclei, to the cerebellar cortex and deep cerebellar nuclei, to the red nucleus and then back to thalamus and cerebral cortex, including all regions of the frontal lobes. Therefore, both the cortical-striatal and cortical-cerebellar projections are anatomically defined as re-entrant systems that are obviously in a position to influence not only motor behavior, but also cognition and affect. This represents overwhelming evidence based upon neuroanatomy alone that subcortical regions play a role in cognition. The first half of this book defines the functional neuroanatomy of cortical-subcortical circuitries and establishes that since structure is related to function, what the basal ganglia and cerebellum do for movement they also do for cognition and emotion. The second half of the book examines neuropsychological assessment. Patients with lesions

restricted to the cerebellum and/or basal ganglia have been described as exhibiting a variety of cognitive deficits on neuropsychological tests. Numerous investigations have demonstrated that higher-level cognitive functions such as attention, executive functioning, language, visuospatial processing, and learning and memory are affected by subcortical pathologies. There is also considerable evidence that the basal ganglia and cerebellum play a critical role in the regulation of affect and emotion. These brain regions are an integral part of the brain's executive system. The ability to apply new methodologies clinically is essential in the evaluation of disorders with subcortical pathology, including various developmental disorders (broadly defined to include learning disorders and certain psychiatric conditions), for the purpose of gaining greater understanding of these conditions and developing appropriate methodologies for treatment. The book is organized around three sources of evidence: neuroanatomical connections; patients with various disease processes; experimental studies, including various imaging techniques. These three

sources of data present compelling evidence that the basal ganglia and cerebellum are involved in cognition, affect, and emotion. The question is no longer if these subcortical regions are involved in these processes, but instead, how they are involved. The book is also organized around two basic concepts: (1) the functional neuroanatomy of the basal ganglia and the cerebellum; and (2) how this relates to behavior and neuropsychological testing. Cognitive neuroscience is entering a new era as we recognize the roles of subcortical structures in the modulation of cognition. The fields of neuropsychology, cognitive psychology, neuropsychiatry, and neurology are all developing in the direction of understanding the roles of subcortical structures in behavior. This book is informative while defining the need and direction for new paradigms and methodologies for neuropsychological assessment.

modifications induced by meditation practice have been consistently addressed by neuroscience. Training meditation practice induced plasticity (Barinaga, 2003; Knight, 2004), and as a consequence several benefit for mental and physical health (Davidson & McEwen, 2012), and cognitive performance. One goal of meditation is to achieve the light of consciousness observing with equanimity (the right distance) clouds of the mind wandering. This Frontiers Research Topic brings together studies from groups of authors whose research focus on neuropsychological systems involved in meditation demonstrating how meditation activates and can modify brain areas, cognitive mechanisms and well-being. Daily Habits and Exercises to Building a Strong Mindset to Create the Life You Want and Achieve Your Goals and Success Penguin

This book proposes a new science of self-control based on the principles of behavioral psychology and economics. Claiming that insight and self-knowledge are insufficient for controlling one's behavior, Howard Rachlin argues that the only way to achieve such control--and

ultimately happiness--is through the development of harmonious patterns of behavior. Most personal problems with self-control arise because people have difficulty delaying immediate gratification for a better future reward. To avoid those problems, the author presents a strategy of "soft commitment," consisting of the development of valuable patterns of behavior that bridge over individual temptations.

Vitality House International, Incorporated Children are already learning at birth, and they develop and learn at a rapid pace in their early years. This provides a critical foundation for lifelong progress, and the adults who provide for the care and the education of young children bear a great responsibility for their health, development, and learning. Despite the fact that they share the same objective - to nurture young children and secure their future success - the various practitioners who contribute to the care and the education of children from birth through age 8 are not acknowledged as a workforce unified by the common knowledge and competencies needed to do their jobs well. Transforming the Workforce for Children Birth Through Age

8 explores the science of child development, particularly looking at implications for the professionals who work with children. This report examines the current capacities and practices of the workforce, the settings in which they work, the policies and infrastructure that set qualifications and provide professional learning, and the government agencies and other funders who support and oversee these systems. This book then makes recommendations to improve the quality of professional practice and the practice environment for care and education professionals. These detailed recommendations create a blueprint for action that builds on a unifying foundation of child development and early learning, shared knowledge and competencies for care and education professionals, and principles for effective professional learning. Young children thrive and learn best when they have secure, positive relationships with adults who are knowledgeable about how to support their development and learning and are responsive to their individual progress. Transforming the Workforce for Children Birth Through Age 8 offers guidance on

system changes to improve the quality of professional practice, specific actions to improve professional learning systems and workforce development, and research to continue to build the knowledge base in ways that will directly advance and inform future actions. The recommendations of this book provide an opportunity to improve the quality of the care and the education that children receive, and ultimately improve outcomes for children.

Integrating Neuropsychological and Psychological Assessments is a resource for neuropsychologists, psychologists, teachers and parents who wish to address both the neurologically- and emotionally-based difficulties with which their children are presenting. In addition to a thorough description of neuropsychological and psychological assessment tools, this book also provides professionals with a unified approach to using the results from assessments to understand and integrate cognitive, behavioral, social and emotional functioning in school-age children. It posits that to educate and treat children who are struggling in school due to unique cognitive or emotional vulnerabilities, the

whole child must be considered to decipher their needs and implement interventions. Cultivating a therapeutic relationship that integrates the emotional and relational functioning of the child enhances both their learning and ability to successfully navigate the world.
