FROM POWDER TO TARGET ; THE INTERNAL AND EXTERNAL BALLISTICS OF SMALL ARMS

Xlibris Corporation

**The information about the book is not yet available as of this time.

Exterior Ballistics Schiffer Pub Limited

The "Exterior Ballistics of Small Arms" is a book mainly about the flight of projectiles of small arms and, at the same time, represents an extension to "Exterior Ballistics with Applications Skydiving, parachute Fall, flying fragments", by Gjergj Klimi, already published by Xlibris in July 30th, 2008. The book contains the Exterior Ballistics PC programs that were not possible to be included in the "Exterior Ballistics with Applications" as well as 76 illustration examples and exercises that can be solved mainly using the Exterior Ballistics PC programs presented in this book. The book has 19 PC Programs. The present book is addressed to amateurs and professionals interested in exterior ballistics, and in shooting with small arms, hunting and sporting rifles, and in general to the readers interested in the field of military and applied science. The simple undergraduate mathematics that is used to present the material and the PC programs makes the book attractive to amateurs and training experts that continuously practice to improve the accuracy of shooting with small arms. The small firearm marksmen find in the book simple theoretical explanations to some basics concepts and characteristics of exterior ballistics and practice of shooting with small arms such as the ballistics coefficient, rifleman's rule, inclined fire, mountain firing, firing in non-standard atmosphere

and in presence of wind, etc. All explanations as well as the proofs of some fundamental rules of exterior ballistics are based on the flight of the projectile in presence of drag.

Long Range Shooting First Edition Xlibris Corporation

Presents high-level research on various caliber guns, cannon, mortars, drones, warheads, shells, bullets, drills and other launchers and penetrants, as well as their impact effects on natural and designed materials, including large-scale targets and body armors Provides new modeling and test data on projectile design and guidance, propellants, charges and explosives for military, aerospace and civil engineering applications Over 250 presentations in two printed volumes, plus searchable CD This book makes available original ballistics technology from around the world on a wide variety of weapons and their effects, including the design and trajectory/stability control of dozens of projectiles ranging from shells to missiles. The book's authors discuss the efficacy and development of propellants, munitions, and igniters and offer new approaches for modeling and testing. Also investigated in Volume 1 are shielding and protection strategies for individual persons and other targets. Volume 2 offers research on the mechanical behavior of multiple types of explosives, as well as impact and penetration data from projectile effects on surfaces ranging from natural phenomena such as water and soils to metallic plating and material-engineered armors. Papers in these volumes were presented at a conference organized by the National Defense Industrial Association (NDIA) with the International Ballistics Society.

ASTIA Subject Headings Xlibris Corporation

Handgun enthusiasts, gun-owning do-it-yourself, law enforcement

officials, and gunsmiths here is the ultimate one-volume guide to acquiring and developing all the necessary skills for making pistol repairs at home, from helpful hints on work space and setting up a small shop, to the tools needed and how to use them properly, to welding, hardening, and gun finishing. All this valuable information, plus much more, is contained in this easy-to-use reference for handgun aficionados.

Some Mathematical Models and Computer Programs for Small Arms Analyses CRC Press

The science of small arms ballistics is seriously underdeveloped and underappreciated. This unique and different book is a comprehensive study that fills a legitimate need for a work that covers the engineering and theory of small arms ballistics. The author shares his extensive research on working out the science of small arm ballistics mathematically and explains his theories, such as the field-effect and the field-effect over trajectory and time, along with new theories on interior, exterior, and terminal ballistics. Each equation describes a mathematical relationship, such as transfer of energy, and has an engineering application to help solve a design problem. Some equations, such as the calculation of bullet length with a given muzzle velocity and rate of twist, represent manipulations of those equations. Some other equations represent a set of mathematical instructions to resolve a technical problem, such as the computation of trajectory or depth of penetration of living tissue in real-time.

BALLISTIC IMAGING

Academic Press

Original research from around the world on weapons-grade

projectiles, warheads, missiles, guns and their effects on target materials New information on shaped charges, fire, control strategies, simulation, blast resistance, non-lethal systems and more 190 original presentations in two printed volumes, plus searchable CD The first part of this 2-volume set, part of an ongoing series, presents previously unpublished research on the design and modeling of ballistic devices ranging from shells to missiles, including explosives, propellants and internal components. The second part investigates the effects of ballistic penetrants on a variety of targets, including human models, as well as hard targets and diverse armors made from engineered fibers, ceramics, metal alloys and concrete. Data is included on the modeling and testing of novel devices, explosives and shielding strategies. Papers in this text were presented at a symposium organized by the National Defense Industrial Association with the International Ballistics Society. The CD-ROM displays figures and illustrations in articles in full color along with a title screen and main menu screen. Each user can link to all papers from the Table of Contents and Author Index and also link to papers and front matter by using the global bookmarks which allow navigation of the entire CD-ROM from every article. Search features on the CD-ROM can be by full text including all key words, article title, author name, and session title. The CD-ROM has Autorun feature for Windows 2000 with Service Pack 4 or higher products along with the program for Adobe Acrobat Reader with Search 11.0. One year of technical support is included with your purchase of this product.

Modern Exterior Ballistics Stackpole Books

Modern Exterior Ballistics is a comprehensive text covering the

basic free flight dynamics of symmetric projectiles. The book provides a historical perspective of early developments in the 19th century, the technology leading to World War I and that through World War II into the modern post-war era. Historical topics include the first ballistic firing tables, early wind tunnel experiments, the development of free flight spark ranges and the first supercomputer, ENIAC, which was designed to compute artillery trajectories for the U.S. Army Ballistic Research Laboratory. The level of the text requires an undergraduate education in mathematics, physics, and mechanical or aerospace engineering. The basic principles of ballistic science are developed from a comprehensive definition of the aerodynamic forces that control the flight dynamics of symmetric projectiles. The author carefully starts with the basic vacuum point mass trajectory, adds the effects of drag, discusses the action of winds, simple flat fire approximations, Coriolis effects and concludes with the classic modified point mass trajectories. Included in the discussion are analytical methods, change of variables from time to distance, numerical solutions and a chapter on the Siacci Method. The Siacci Method provides a historical perspective for computing flat fire trajectories by simple quadrature and is used in the sporting arms industry. The final six chapters of the book present an extensive physical and mathematical analysis of the motion of symmetric projectiles. The linearized equations of angular and swerving motion are derived in detail. The effects of mass asymmetry, in-bore yaw, cross wind and launch in a slipstream are discussed. Special consideration is given to the derivation and explanation of aerodynamic jump. These subjects are then expanded to include a complete chapter on nonlinear

aerodynamic forces and moments. The final chapter in the book presents an overview of experimental methods for measuring the flight dynamics of projectiles. The great forte of Modern Exterior Ballistics is the author's effort to provide many fine specific examples of projectile motion illustrating key flight behaviors. The extensive collection of data on projectiles from small arms to artillery used to substantiate calculations and examples is alone a valuable reference. The ultimate joy of the book is the incomparable comprehensive set of flow field shadow graphs illustrating the entire spectrum of projectile flight from subsonic, through transonic and supersonic. The volume is a necessary addition to any undergraduate or graduate course in flight dynamics.

Systems Analysis and Modeling Xlibris Corporation

Wenn Sie an Ballistik interessiert sind, werden Sie hier (in englischer Sprache) einiges über militärische Gewehrpatronen aus der Zeit etwa 1890 bis 1950 finden. Das Buch zeigt die Grundlagen dafür auf, historische Schusstafeln auf modernen Computern nachzubilden und damit vergleichbar zu machen. Es orientiert sich dabei besonders am Aussenballistik-Programm EB von Ruprecht Nennstiel. Das Buch behandelt damit einen Bereich, in dem Technikgeschichte und Militärgeschichte sich berühren. Ein RWS Luftwiderstandsgesetz von 1943 wird erstmals dargestellt. If you are interested in ballistics, here you will find valuable data regarding some military rifle cartridges from about 1890 to 1950. The book lays a foundation for emulating historic firing tables on modern computers, making possible their direct comparison. It was written especially with exterior ballistics program EB by Ruprecht Nennstiel in mind. The subject of this book touches

both, military history and history of technology. An RWS resistance law of 1943 is shown for the first time.

EXTERIOR BALLISTICS OF SMALL ARMS

Macmillan

This Is A New Release Of The Original 1909 Edition.

Handbook of Firearms and Ballistics CRC Press

Written by the nation's foremost authority on gunshot wounds and forensic techniques as they relate to firearm injuries, *Gunshot Wounds: Practical Aspects of Firearms, Ballistics, and Forensic Techniques, Second Edition* provides critical information on gunshot wounds and the weapons and ammunition used to inflict them. The book describes practical aspects of ballistics, wound ballistics, and the classification of various wounds caused by handguns, bang guns, rifles, and shotguns. The final chapters explain autopsy technique and procedure and laboratory analysis relating to weapons and gunshot evidence.

Their Ammunition, Ballistics and Use DEStech Publications, Inc

A collection of some mathematical models and their computer programs related to small arms are presented. The models encompass three areas: interior ballistics, exterior ballistics and target effectiveness. The interior ballistic models includes five models for projectile design, propellant charge, cartridge case, case design and cartridge design. The exterior ballistics model provides two-dimensional trajectories. Eight models are given for target effectiveness models: individual soldier, heavy machine gun emplacement, bunker, hemisphere, squad, hidden point target in area, helmet penetration and brush penetration. Some

description of assumptions, formulas, input and output formats with numerical examples are given. This work provides the basis for a parametric design analysis for the light-weight machine gun but has applications in other areas as well.

SCIENCE AND ENGINEERING OF SMALL ARMS

Elsevier

Ballistic Imaging assesses the state of computer-based imaging technology in forensic firearms identification. The book evaluates the current law enforcement database of images of crime-related cartridge cases and bullets and recommends ways to improve the usefulness of the technology for suggesting leads in criminal investigations. It also advises against the construction of a national reference database that would include images from test-fires of every newly manufactured or imported firearm in the United States. The book also suggests further research on an alternate method for generating an investigative lead to the location where a gun was first sold: "microstamping," the direct imprinting of unique identifiers on firearm parts or ammunition.

Updated to incorporate the latest armaments used in Kosovo, Afghanistan, Iraq, and Israel, a comprehensive survey of the history of weapons traces the evolution of arms, including specifications, from clubs to tomorrow's sophisticated technologies, placing weapons in the context of their time. Original. 20,000 first printing.

The Bullet's Flight from Powder to Target Exterior Ballistics of Small Arms Projectiles Exterior Ballistics of Small Arms Exterior Ballistics: A New Approach presents the exterior ballistics of point-mass projectiles based on the analytical G-drag functions (G_1 , G_2 , ... G_7 , G_8 , Siacci's G-function, etc.) and on the "projectile trajectory-streamline and Snell's law" model that is a fundamental result obtained by applying, to the flight of projectiles, the postulate of Sir Isaac Newton on the wave nature of moving bodies and his interpretation of the Snell's law on refraction of waves. The impressive outcomes obtained solving exterior ballistics problems employing Snell's law demonstrate that the flight of objects can be quantitatively described using wave properties of particles. The WONDERS of Using Snell's Law in Exterior Ballistics Exterior Ballistics: A New Approach is a unique book in the literature of exterior ballistics for the original methods introduced to solve the exterior ballistics problems and particularly for the use of Snell's law in exterior ballistics. Backed with in-depth discussions based on comprehensive research and

study, Exterior Ballistics: A New Approach provides original solutions in solving exterior ballistics problems especially employing the "projectile trajectory-streamline and Snell's law" model. The use of Snell's law simplifies the ballistics calculations reducing them to simple mathematics operations. Exterior Ballistics: A New Approach is an excellent reference book that provides answers to problems encountered in the practice of motion of unguided projectiles fired by artillery and small arms. The book has around 80 solved exterior ballistics problems that illustrate the theoretical topics, guide and help the reader to solve similar and new ballistics problems. There are included four compact types of original universal PC programs that enable the reader to solve any exterior ballistics problem as well as the ballistics problems related with fire control of unguided projectiles. Exterior Ballistics: A New Approach is an informative book highly recommended to students, professors, and novice, military students and faculty, as well as to experienced ballisticians.

28th International Symposium on Ballistics National Academies Press

The noteworthy findings and innovative methods of predicting projectile trajectory, introduced in my books Exterior Ballistics: A New Approach (EBNA), Xlibris, 2010; and Exterior Ballistics with Applications (EBA3e), Xlibris, third edition, December 2011, require a methodical approach and further development. As result, the amateurs and professionals interested in exterior ballistics of firearms, and especially in long-range shooting with small arms, have a new book, Exterior Ballistics: The Remarkable Methods (EBRM), that aims to enrich the foundations of modern

exterior ballistics and to lessen the complexity of physics and mathematics techniques in use. Exterior Ballistics: The Remarkable Methods is a book that combines and develops further the methods introduced in EBA3e, EBNA, and in the Exterior Ballistics of Small Arms (EBSA, Xlibris 2009). The foundations of the book are mainly the findings and the innovative ballistics methods presented in EBA3e and EBNA. The remarkable methods of exterior ballistics presented in this new book include: The methods of determining the function of resistance $G(v)$ of a given bullet ($i=1$) using range tables, or the experimental data measurements of three or four coordinates at the points of projectile impact. The model of "Tangent Law of Trajectory Refraction" and the related set of formulas that we use to study the trajectories of projectiles in nonstandard atmosphere. Series expansion method and the techniques of (second to sixth order) parabolas we employ to predict with great accuracy the projectile trajectory. The exceptional Siacci's methods that we apply as well for the projectile trajectory in nonstandard atmosphere and in inclined shooting combined with the tangent law of trajectory refraction. It is important to note that using the similarity laws of fluid dynamics we have obtained the "tangent law of projectile refraction," which represents a progress with respect to "Newton Snell's law" on projectile refraction. For better understanding of the information presented in the book, the reader should refer to my three preceding books on exterior ballistics, already published by Xlibris, although most of the material is self-contained and clear enough to be accessed and assimilated by a wide range of readers. The system of units used in the book is the International System (SI). For readers that

are unfamiliar with the SI system it is not difficult to become accustomed and use the materials presented in the book to benefit from the simple illustrations, exercises, and PC programs that, at the same time, give answers to many problems encountered in practice. My studies and writing work in exterior ballistics intend to find new and simple mathematical models and methods to predict the elements of the projectile trajectory. I believe that I have achieved some good results, which need to be further developed. George Klimi, PhD New York, December 2012
 gklimi@pace.edu iven24@aol.com gklimi@citytech.cuny.edu
BALLISTICS 2014 Literary Licensing, LLC

This book initiates with the story of the evolution of firearms to enable the reader to appreciate the sequence of the development of firearms. It discusses different classes of small arms, their mechanics, internal and external ballistics. Further, it covers the design idea of barrels and actions, various operating principles and relevant discussion on ammunition and propellants. The principle of quality in the design of the small arms is also elaborated in the desired degree. The book brings out the relevance of modern manufacturing technologies like MIM and various surface treatments, and polymers for enhancement of product quality. To appreciate the sophistication of the architecture, the book presents the anatomical details of a few small arms of repute. Provides complete understanding of overall small weapon systems Explores mechanics and physics of small arms Discusses proper design, quality control, and manufacturing process selections for a good weapon Covers common type of weapon failures and catastrophic failure Includes relevance of manufacturing processes The book is aimed at

professionals and graduate students in Mechanical Design, Armament Design, Gun Design including personnel in the military, paramilitary, police, and all other armed forces and their maintenance crews.

THEORY AND DESIGN OF GUNS AND AMMUNITION, THIRD EDITION

CRC Press

Even the earliest weapon developers faced the need to understand how and why guns and ammunition work in order to improve their effectiveness. As weapons became more sophisticated, the field of ballistics naturally divided into three main areas of specialization: interior, exterior, and terminal ballistics. Providing unique coverage of all three ar

SA 1573 CRC Press

Originally published in 1935, *Textbook of Pistols and Revolvers* is a treatise on handguns of the early twentieth century. Written by Major Julian S. Hatcher, an expert on the subject of firearms of all sorts, readers will gain invaluable insight into everything to do with handheld firearms of the 1930s. In his introduction, Hatcher emphasizes that he has made an earnest effort to make this book accessible for both novices and experts. Novices who know nothing whatsoever about firearms and their use can easily learn from this book, while experts will find a technical reference book where "the results of many experiments with pistols and revolvers and their ammunition are tabulated in convenient form." Covering such subjects as the different methods of shooting and using hand firearms; their mechanism, care and repair; their interior and exterior ballistics; the peculiar suitability

of the different kinds for various purposes; the relative effectiveness or stopping power of the various calibers and types of gun and ammunition; and many more, this book is an immense store of knowledge on early handguns. Skyhorse Publishing is proud to publish a broad range of books for hunters and firearms enthusiasts. We publish books about shotguns, rifles, handguns, target shooting, gun collecting, self-defense, archery, ammunition, knives, gunsmithing, gun repair, and wilderness survival. We publish books on deer hunting, big game hunting, small game hunting, wing shooting, turkey hunting, deer stands, duck blinds, bowhunting, wing shooting, hunting dogs, and more. While not every title we publish becomes a New York Times bestseller or a national bestseller, we are committed to publishing books on subjects that are sometimes overlooked by other publishers and to authors whose work might not otherwise find a home.

The Bullet's Flight from Powder to Target. The Internal and External Ballistics of Small Arms, Etc. [With a Biographical Notice by N.E. Paine, and with a Portrait.]

DEStech Publications, Inc

In order to assess the value added by the application of fire control technology to sniper weapons, "error budgets" are developed as a function of range for several sniper weapon systems. A system is comprised of the weapon and its associated ammunition as well as the type of fire control technology provided that weapon. For this study, a total of four weapon-ammunition combinations were used and three levels of fire control sophistication were examined. The "baseline system" consists of a two-person sniper team using a standard rifle,

spotting scope, and laser range finder to make aiming corrections. The "cross-wind system" adds a laser crosswind sensing device and more accurate range finder incorporated into the spotting scope. The "fire control system" performs a full

ballistic firing solution and presents a real-time corrected aim point to the shooter. One-sigma system errors and probabilities of hit against an E-silhouette target are calculated.
