Dive into Systems is a vivid introduction to computer organization, architecture, and operating systems that is already being used as a classroom textbook at more than 25 universities. This textbook is a crash course in the major hardware and software components of a modern computer system. Designed for use in a wide range of introductory-level computer science classes, it guides readers through the vertical slice of a computer so they can develop an understanding of the machine at various layers of abstraction. Early chapters begin with the basics of the C programming language often used in systems programming. Other topics explore the architecture of modern computers, the inner workings of operating systems, and the assembly languages that translate human-readable instructions into a binary representation that the computer understands. Later chapters explain how to optimize code for various architectures, how to implement parallel computing with shared memory, and how memory management works in multi-core CPUs. Accessible and easy to follow, the book uses images and hands-on exercise to break down complicated topics, including code examples that can be modified and executed.

This textbook introduces the Ada programming language in a manner suitable for students with little or no previous experience of programming. It shows how solutions can be systematically designed and how these solutions can then be implemented on a computer. The early parts of the book concentrate on solving small problems while the later parts show how packages can be used in the construction of reliable large programs. As Ada is a complex and versatile language, no attempt is made to cover it all. The author concentrates on central features such as data types, subprograms, packages, separate compilation, exceptions and files. He provides in addition a large number of complete Ada programs, all of which have been tested on the York Ada compiler. The final version of the Ada language (ANSI/MIL-STD-1815A-1983) is used throughout.
