Surgical Exposures in Orthopaedics Handbook of Fractures

This book provides a practical guide to diagnostic radiology, with each chapter presenting a case-based tutorial that illustrates a specific aspect of diagnostic radiology required for undergraduate study. In addition, it discusses and assesses issues concerning basic principles in diagnostic radiology, imaging of head trauma, non-traumatic neurological emergencies, chest radiographs, pediatric radiology, and emerging radiological technologies. Tutorials in Diagnostic Radiology for Medical Students is intended as a self-study guide, and offers a valuable asset for medical students and trainee radiologists, as well as educators.

This unique text focuses entirely on the treatment of pediatric elbow fractures, which encompass the vast majority of operative cases for pediatric fracture care, and which can be challenging to even the most experienced surgeon. The book opens with a survey of the basic anatomy and development of the elbow, as well as examination and imaging techniques. Both acute and chronic fractures are then discussed in detail, beginning with a brief outline of the epidemiology, classification, and work-up of each fracture, but the main focus will be on providing a master's approach to the surgical treatment of these injuries, including supracondylar fractures, capitellar shear fractures, elbow dislocations, Monteggia fracture dislocations, and cubitus varus and valgus, among others. Numerous photographs, figures and videos will enable the orthopedic surgeon, hand surgeon, and trauma surgeon to be fully prepared to treat any of these fractures.

The distal radius is one of the most common fracture sites reported. There are a wide variety of therapeutic options available to treat this injury, but little data to determine which strategies provide the best long term functional outcomes. This volume utilizes the technical expertise from experts based around the world to provide a deep understanding of the current trends and evidence concerning this prevalent injury.

The Candidate's Guide to the FRCS (Tr & Orth) Examination F.A. Davis

The editors, along with 15 outstanding contributors, comprehensively explore and provide an overview of the principles behind the interpretation of skeletal blunt force trauma. This expanded second edition provides a discussion on how to train for a career in forensic anthropology and offers guidance on how to complete a thorough trauma analysis. It also provides the labels given to different kinds of fractures and the biomechanical forces required to cause bone to fail and fracture. The text provides a theoretical framework for both evaluating published trauma studies and designing new ones. Experimental trauma research is an area ripe for research, and criteria to consider in choosing which non-human species to use in an actualistic study are offered. Common circumstances in which blunt force trauma is encountered are described. Information is provided on a variety of causes of death due to blunt force trauma. These causes range from accidental deaths to homicides due to blunt force from motor vehicle accidents, falls, strangulation, child and elder abuse, among others. Epidemiological information on whom is most likely affected by these various kinds of blunt force trauma is drawn from both the clinical and forensic literature. The most

fundamental elements of the text are offered in four chapters where, bone by bone, fracture by fracture, the authors describe what to call each kind of fracture, what is known about how much force is required to break the bone that way, and fracture specific epidemiological information. This particular section of the text provides an invaluable reference source for forensic anthropologists and other osteologists to consult when looking at and trying to classify a bone fracture. Case studies are included to bring the book full circle back to considering the micro and macro bone changes that are seen when bone fails and fractures. The case studies are illustrative both of the concepts described through the book and of the high quality analyses forensic anthropologists contribute to medicolegal investigations of death every day. The text is further enhanced by 150 illustrations, some in color. This completely updated and expanded new volume is an essential reference for the forensic anthropology professional.
