Neo4j is a graph database that allows you to model your data as a graph and find solutions to complex real-world problems that are difficult to solve using any other type of database. This book is designed to help you understand the intricacies of modeling a graph for any domain. The book starts with an example of a graph problem and then introduces you to modeling non-graph problems using Neo4j. Concepts such as the evolution of your database, chains, access control, and recommendations are addressed, along with examples and are modeled in a graph. Throughout the book, you will discover design choices and trade-offs, and understand how and when to use them. By the end of the book, you will be able to effectively use Neo4j to model your database for efficiency and flexibility.

Scores of talented and dedicated people serve the forensic science community, performing vitally important work. However, they are often constrained by lack of adequate resources, sound policies, and national support. It is clear that change and advancements, both systematic and scientific, are needed in a number of forensic science disciplines to ensure the reliability of work, establish enforceable standards, and promote best practices with consistent application. *Strengthening Forensic Science in the United States: A Path Forward* provides a detailed plan for addressing these needs and suggests the creation of a new government entity, the National Institute of Forensic Science, to establish and enforce standards within the forensic science community. The benefits of improving and regulating the forensic science disciplines are clear: assisting law enforcement officials, enhancing homeland security, and reducing the risk of wrongful conviction and exonerated. *Strengthening Forensic Science in the United States* gives a full account of what is needed to advance the forensic science disciplines, including upgrading of systems and organizational structures, better training, widespread adoption of uniform and enforceable best practices, and mandatory certification and accreditation programs. While this book provides an essential call-to-action for congress and policy makers, it also serves as a vital tool for law enforcement agencies, criminal prosecutors and attorneys, and forensic science educators.

With the increasing application of software in systems, especially safety- or even life-critical systems, it is no longer sufficient for the software developer to rely solely on testing the code produced. Testing must begin with the specification of requirements, continue on the design and finally on the implemented system. This book gives guidance on how testing can be carried out at each of the stages of software development. It does this by looking at the development process from four viewpoints: that of the intended user of the system, of its designers, of its programmers, and of the manager responsible for development. The product of each stage of development is individually examined to see how it can be checked for correctness and consistency with earlier specifications. References are given to techniques available to the software developer and there are many helpful checklists. The contributors are all members of the British Computer Society's Working Group on Testing, and between them have an impressive breadth of practical experience in the commercial development of small and large software systems. Their combined experience makes this a most valuable book for the computing professional.

Since the enactment of the Airline Deregulation Act in 1978, questions that had been at the heart of the ongoing debate about the industry for eighty years gained a new intensity: Is there enough competition among airlines to ensure that passengers do not pay excessive fares? Can an unregulated airline industry be profitable? Is air travel safe? While economic regulation provided a certain stability for both passengers and the industry, deregulation changed everything. A new fare structure emerged; travelers faced a variety of fares and travel restrictions; and the offerings changed frequently. In the last fifteen years, the airline industry's earnings have fluctuated wildly. New carriers entered the industry, but several declared bankruptcy, and Eastern, Pan Am, and Midway were liquidated. As financial pressures mounted, fears have arisen that air safety is being compromised by carriers who cut costs by skimping on maintenance and hiring inexperienced pilots. Deregulation itself became an issue with many critics calling for a return to some form of regulation. In this book, Steven A. Morrison and Clifford Winston assert that all too often public discussion of the issues of airline competition, profitability, and safety take place without a firm understanding of the facts. The policy recommendations that emerge frequently ignore the long-run evolution of the industry and its capacity to solve its own problems. This book provides a comprehensive profile of the industry as it has evolved, both before and since deregulation. The authors identify the problems the industry faces, assess their severity and their underlying causes, and indicate whether government policy can play an effective role in improving performance. They also develop a basis for understanding the industry's evolution and how the industry will eventually adapt to the unregulated economic environment. Morrison and Winston maintain that although the airline industry has not reached long-run equilibrium, its evolution is proceeding in a positive direction—one that will preserve and possibly enhance the benefits of deregulation to travelers and carriers. They conclude that the federal government's primary policy objective should be to expand the benefits from unregulated market forces to international travel. This 192 page report describes the experiences of the Rural Connection Program (RCP), an attempt to link existing rural public transportation services with those of intercity carriers. The study includes data gathered from 36 of the rural systems participating in the program, and detailed case studies of four systems among these. The RCP has not proven to be a big generator of revenue for the participating systems, and only five systems reported more than 150 riders over the course of the program. There is some evidence that local resources and expertise for marketing may be particular limiting factors on the arrangements. The report should be especially interesting to operators of rural transportation services.
