The monograph is about a meta-theory of knowledge-production process and the logical pathway that connects the epistemic possibility to the epistemic reality. It examines the general

conditions of paradigms for information processing and isolates the classical and fuzzy paradigms for comparative analysis. The sets of conditions that give rise to them are defined, stated and analyzed to abstract the corresponding sets of laws of thought. The fuzzy paradigm with its corresponding logic and mathematics is related to inexact symbolism for the defective information structure where the results of the knowledge production must satisfy the epistemic

conditionality, composed of fuzzy conditionality and fuzzy-stochastic conditionality under the principle of logical duality with continuum. The classical paradigm with its corresponding logic and mathematics is related to exact symbolism for exact information structure where the vagueness component of the defectiveness is assumed away, and where the results of the knowledge production must satisfy no epistemic conditionality or at the maximum only the

stochastic conditionality under the principle of logical dualism with excluded middle. It is argued that the epistemic path that links ontological space to the epistemological space is information. The ontological space is taken as the primary category of reality while the epistemological space is shown to be a derivative. Such information is universally defective and together with assumptions imposed guides the development of paradigms with their

laws of thought, logic of reasoning, mathematics and computational techniques. The relational structure is seen in terms of logical trinity with a given example as matter-information-energy transformational trinity which is supported by the time trinity of past-present-future relationality. The book is written for professionals, researchers and students working in philosophy of science, decision-choice theories, economics, sciences, computer science, engineering,

cognitive psychology and researchers working on, or interested in fuzzy paradigm, fuzzy logic, fuzzy decisions, and phenomena of vagueness and ambiguities, fuzzy mathematics, fuzzy-stochastic processes and theory of knowledge. It is further aimed at research institutions and libraries. The subject matter belongs to extensive research and development taking place on fuzzy phenomena and the debate between the fuzzy paradigm and the classical paradigm

relative to informatics, synergetic science and complexity theory. The book will have a global appeal and across disciplines. Its strength, besides the contents, is the special effort that is undertaken to make it relevant and accessible to different areas of sciences and knowledge production.

Based on careful analysis
of burden of disease and
the costs of interventions,
this second edition of
'Disease Control Priorities
in Developing Countries,
2nd edition' highlights
achievable priorities;
measures progress toward
providing efficient,
equitable care; promotes
cost-
effective interventions to
targeted populations; and
encourages integrated

efforts to optimize health.
Nearly 500 experts -
scientists,
epidemiologists, health
economists, academicians,
and public health
practitioners - from
around the
world contributed to the
data sources and
methodologies, and
identified challenges and
priorities, resulting in this
integrated,
comprehensive reference
volume on the state of
health in developing
countries.

This book examines the various patterns of nominal and pronominal address used in Jamaica and Trinidad, the two most populous islands of the English-speaking Caribbean. Given that the Anglo-Caribbean context has so far been largely neglected in address research, this study aims to provide an in-depth analysis of the linguistic means Jamaicans and Trinidadians have at their disposal and make use of

to address each other. A particular focus will be on variation in the speakers' address behaviour with regard to their sex, age, social class, ethnicity, and regional background. The study draws both on data from a self-compiled corpus of postcolonial Jamaican and Trinidadian literary works, and on questionnaire and interview data collected during fieldwork. This book contributes to the ever-growing body of research in the field of nominal and pronominal address, and will be

relevant to researchers interested in the fields of sociolinguistics, pragmatics, and World Englishes.

The Massachusetts register Elsevier

Elements of Probability Theory presents the methods of the theory of probability. This book is divided into seven chapters that discuss the general rule for the multiplication of probabilities, the fundamental properties of the subject matter, and the classical definition of probability. The

introductory chapters deal with the functions of random variables; continuous random variables; numerical characteristics of probability distributions; center of the probability distribution of a random variable; definition of the law of large numbers; stability of the sample mean and the method of moments; and Chebyshev's theorem. The next chapters consider the limit theorem of de Moivre-Laplace and the solution of two fundamental problems in

the theory of errors. The discussion then shifts to the best linear approximation to the regression function. The concluding chapters look into the central limit theorem of Lyapunov and the significance of the value of the coefficient of correlation. The book can provide useful information to the statisticians, students, and researchers.

Taking continuous-time stochastic processes allowing for jumps as its starting and focal point, this book provides an accessible introduction to the stochastic calculus

and control of semimartingales and explains the basic concepts of Mathematical Finance such as arbitrage theory, hedging, valuation principles, portfolio choice, and term structure modelling. It bridges the gap between introductory texts and the advanced literature in the field. Most textbooks on the subject are limited to diffusion-type models which cannot easily account for sudden price movements. Such abrupt changes, however, can often be observed in real

markets. At the same time, purely discontinuous processes lead to a much wider variety of flexible and tractable models. This explains why processes with jumps have become an established tool in the statistics and mathematics of finance. Graduate students, researchers as well as practitioners will benefit from this monograph. *Elements of Probability Theory* Routledge Chapter wise and Topic wise introduction to enable quick revision. work on the topic of learner-centered teaching in the college and university classroom. As the author explains, learner-centered teaching focuses attention on what the student is learning, how the student is learning, the conditions under which the student is learning, whether the student is retaining and applying the learning, and how current learning positions the student for future learning. To help educators accomplish the goals of learner-centered teaching, this important

book presents the meaning, practice, and ramifications of the learner-centered approach, and how this approach transforms the college classroom environment. Learner-Centered Teaching shows how to tie teaching and curriculum to the process and objectives of learning rather than to the content delivery alone.

DEFINING YOUR MARKET

Springer
"This volume provides an authoritative synthesis of a dynamic, influential area of psychological research. Leading investigators address all aspects of dual-process theories: their core assumptions, conceptual

foundations, and applications to a wide range of social phenomena. In 38 chapters, the volume addresses the pivotal role of automatic and controlled processes in attitudes and evaluation; social perception; thinking and reasoning; self-regulation; and the interplay of affect, cognition, and motivation. Current empirical and methodological developments are described. Critiques of the duality approach are explored and important

questions for future research identified"--

This book introduces readers to a powerful method for cross-cultural due diligence in mergers and organizational collaborations. It employs the context of joint ventures between local communities and

companies in the domain of hospitality in emerging tourism destinations. The book first analyzes the impact of cultural diversity in mergers between local communities and the private sector, revealing the characteristics and functions of culture and paying specific attention to the roles of organizational and community cultures in hospitality. In two subsequent methodological chapters the book presents a theoretical framework for

cultural due diligence and identifies the principal actors, technical aspects and core principles. On the basis of a separate case study from northern Thailand, the book provides an example of cultural context analysis and presents the findings and results. In a concluding chapter the book presents an outlook on further research and development in this field.

WINNING STRATEGIES FOR HIGH-TECH, INDUSTRIAL, AND

SERVICE FIRMS

Springer Science & Business Media

Taking due account of extreme events when constructing portfolios of assets or liabilities is a key discipline for market professionals. Extreme events are a fact of life in how markets operate. In *Extreme Events: Robust Portfolio Construction in the Presence of Fat Tails*, leading expert Malcolm Kemp shows readers how to analyse market data to uncover fat-tailed behaviour, how to

incorporate expert judgement in the handling of such information, and how to refine portfolio construction methodologies to make portfolios less vulnerable to extreme events or to benefit more from them. This is the only text that combines a comprehensive treatment of modern risk budgeting and portfolio construction techniques with the specific refinements needed for them to handle extreme events. It explains in a logical sequence what

constitutes fat-tailed behaviour and why it arises, how we can analyse such behaviour, at aggregate, sector or instrument level, and how we can then take advantage of this analysis. Along the way, it provides a rigorous, comprehensive and clear development of traditional portfolio construction methodologies applicable if fat-tails are absent. It then explains how to refine these methodologies to accommodate real world behaviour. Throughout,

the book highlights the importance of expert opinion, showing that even the most data-centric portfolio construction approaches ultimately depend on practitioner assumptions about how the world might behave. The book includes: Key concepts and methods involved in analysing extreme events A comprehensive treatment of mean-variance investing, Bayesian methods, market consistent approaches, risk budgeting, and their

application to manager and instrument selection A systematic development of the refinements needed to traditional portfolio construction methodologies to cater for fat-tailed behaviour Latest developments in stress testing and back testing methodologies A strong focus on the practical implementation challenges that can arise at each step in the process and on how to overcome these challenges “Understanding how to model and analyse the

risk of extreme events is a crucial part of the risk management process. This book provides a set of techniques that allow practitioners to do this comprehensively.” Paul Sweeting, Professor of Actuarial Science, University of Kent “How can the likeliness of crises affect the construction of portfolios? This question is highly topical in times where we still have to digest the last financial collapse. Malcolm Kemp gives the answer. His book is highly recommended to experts

as well as to students in the financial field.”

Christoph Krischanitz, President Actuarial Association of Austria, Chairman WG “Market Consistency” of Groupe Consultatif

WITH FORMULAS, GRAPHS, AND MATHEMATICAL TABLES

John Wiley & Sons
This revised and enlarged second edition is devoted to asymptotical questions of the theory of entire and plurisubharmonic functions. A separate

chapter deals with applications in biophysics. The book is of interest to research specialists in theoretical and applied mathematics, postgraduates and students who are interested in complex and real analysis and its applications.

On Principles and Methods in Latin Syntax World Bank Publications

To date, the theoretical development of q -calculus has rested on a non-uniform basis. Generally, the bulky Gasper-Rahman

notation was used, but the published works on q -calculus looked different depending on where and by whom they were written. This confusion of tongues not only complicated the theoretical development but also contributed to q -calculus remaining a neglected mathematical field. This book overcomes these problems by introducing a new and interesting notation for q -calculus based on logarithms. For instance, q -hypergeometric functions

are now visually clear and easy to trace back to their hypergeometric parents. With this new notation it is also easy to see the connection between q-hypergeometric functions and the q-gamma function, something that until now has been overlooked. The book covers many topics on q-calculus, including special functions, combinatorics, and q-difference equations. Apart from a thorough review of the historical development of q-calculus, this book also presents the domains of

modern physics for which q-calculus is applicable, such as particle physics and supersymmetry, to name just a few.
Cultural Due Diligence in Hospitality Ventures SBPD Publications
 Explains processes and scenarios (process chains) for planning with SAP characteristics. Uses the latest releases of SAP R/3 and APO (Advanced Planning & Optimization software). The levels scenario, process and function are explained from the business case down to the

implementation level and the relations between these levels are consistently pointed out throughout the book Many illustrations help to understand the interdependencies between scenario, process and function Aims to help avoiding costly dead ends and securing a smooth implementation and management of supply chains
Smoothing of Multivariate Data CRC Press
 For manufacturers of complex engineering equipment, the focus on

service and achieving outcomes for customers is the key to growth. Yet, the capability to provide service for complex engineered products is less understood. Taking a trans-disciplinary approach, Complex Engineering Service Systems covers various aspects of service in complex engineering systems, with perspectives from engineering, management, design, operations research, strategy, marketing and operations management

that are relevant to different disciplines, organisation functions, and geographic locations. The focus is on the many facets of complex engineering service systems around a core integrative framework of three value transformations – that of material/equipment, information and people. Complex Engineering Service Systems is the outcome of the EPSRC/BAE Systems S4T (Service Support Solutions: Strategy and Transition) research

programme of 10 universities and 27 researchers, which examined how high-value manufacturers of complex engineering products adapt to a multi-partnered environment to design and deliver value in a service system. Complex Engineering Service Systems aims to be the main source of knowledge for academics and professionals in the research and practice of contracting, managing, designing, leading, and delivering complex engineering service

systems. The book takes a value-based approach to integrating equipment and human factors into a total service provision. In doing so, it aims to advance the field of service systems and engineering.

A Methodological Approach for Joint Ventures of Local Communities and Companies Oswaal Books and Learning Private Limited

In response to a request by the Health Care Financing Administration (HCFA), the Institute of

Medicine proposed a study to examine definitions of serious or complex medical conditions and related issues. A seven-member committee was appointed to address these issues. Throughout the course of this study, the committee has been aware of the fact that the topic addressed by this report concerns one of the most critical issues confronting HCFA, health care plans and providers, and patients today. The Medicare+Choice regulations focus on the

most vulnerable populations in need of medical care and other services-those with serious or complex medical conditions. Caring for these highly vulnerable populations poses a number of challenges. The committee believes, however, that the current state of clinical and research literature does not adequately address all of the challenges and issues relevant to the identification and care of these patients.
