## MICAH MALLORY

### Economics Class 11 - [Bihar Board] SBPD Publications

The purpose of this book, first published in 1982, is to probe the nature of the state in India and the role played by it in the evolution of the social economy, particularly in the growth of industry. In fact, the problematic of the state and its relationship with socio-economic progression or regression is a dialectic process. What this book does is attempt to unravel this dialectic, by following the theory and method of Maxism.

**Problems and Solutions In Accountancy Class 11 [CBSE Board]** Economics Class XI by Dr. Anupam Agarwal, Mrs. Sharad Agarwal (SBPD Publications)

"[A] sharply observed study . . . richly detailed portraits."—Economist Somini Sengupta emigrated from Calcutta to California as a young child in 1975. Returning thirty years later as the bureau chief for The New York Times, she found a vastly different country: one defined as much by aspiration and possibility—at least by the illusion of possibility—as it is by the structures of sex and caste. The End of Karma is an exploration of this new India through the lens of young people from different worlds: a woman who becomes a Maoist rebel; a brother charged for the murder of his sister, who had married the "wrong" man; a woman who opposes her family and hopes to become a police officer. Driven by aspiration—and thwarted at every step by state and society—they are making new demands on India's democracy for equality of opportunity, dignity for girls, and civil liberties. Sengupta spotlights these stories of ordinary men and women, weaving together a groundbreaking portrait of a country in turmoil.

This book constitutes the refereed proceedings of the Third International Conference on Machine Learning, Image Processing, Network Security and Data Sciences, MIND 2021. The papers are organized according to the following topical sections: data science and big data; image processing and computer vision; machine learning and computational intelligence; network and cybersecurity. This book aims to develop an understanding of image processing, networks, and data modeling by using various machine learning algorithms for a wide range of real-world applications. In addition to providing basic principles of data processing, this book teaches standard models and algorithms for data and image analysis.

SBPD Publications

Polynucleotide ligases preserve the integrity of the 3'-5' phosphodiester backbone in DNA and RNA -- a crucial aspect in the life cycle of any organism. This thesis explores various mechanisms that are employed during RNA damage and repair. Cyclic phosphates are key species in cellular RNA damage and repair pathways. Mechanistically, there are two distinct enzymatic routes to generate 2',3'-cyclic phosphate ends - transesterification and de novo cyclization using ATP. In this work, I have investigated reaction pathways that generate and utilize these cyclic phosphate ends in the context of RNA damage and repair. Specifically, I have studied cyclic-phosphate generation by RtcA ( E. coli Rtc homolog) and PaT (a eukaryal anticodon nuclease) from a structure-function perspective as well as cyclic-phosphate utilization by RtcB, a recently discovered RNA ligase. I trapped and crystallized E. coli RtcA at discrete stages of the reaction pathway. Crystal structures of RtcA\*ATP binary complex, RtcA\*ATP\*metal ternary complex and an RtcA\*AMP product complex were solved. These structural snapshots helped reconstruct the covalent adenylation of RtcA at atomic resolution. The key findings from the study illustrated: i) metal induced reorganization of the phosphates of ATP to place the pyrophosphate leaving group apical to the active site histidine for an inline nucleophilic attack, ii) metal is not required for steps 2 & 3 of cyclization, later confirmed by biochemical assays, iii) molecular roles of conserved residues in the RtcA active site were assigned. I was also able to demonstrate the ligase-like capability of RtcA to adenylylate 5'-monophosphate ends of DNA and RNA. In E. coli and several other bacteria, rtcA is part of an operon with rtcB - a gene encoding for a protein whose function was unknown until 2011. RtcB was found to be a bona-fide tRNA ligase in vitro and in vivo . Using biochemical and mass spectrometric methods, I tested the veracity of the proposed 'direct' ligation mechanism of RtcB. By isolating intermediates at discrete stages in the reaction pathway, I discovered that the 2',3'-cyclic phosphate/5'-hydroxyl ligation catalyzed by RtcB is not direct and entails - (i) reaction of His337 with GTP to form a covalent RtcB-(histidinyl-N)-GMP intermediate; (ii) hydrolysis of the 2',3'-cyclic phosphate to a 3'-phosphate (iii) transfer of guanylate to a RNA 3'-phosphate to form RNAppG intermediate; (iv) attack of 5'-hydroxyl moiety on the -RNAppG end to form the sealed phosphodiester. RtcB catalyzed RNA ligation is the first known example of a

polynucleotide ligase that works via 3'-end activation. It raises the possibility of an alternative enzymology based on 3'-activated ends in nucleic acids. Fungal anticodon nucleases (ACNases) are toxins that cause growth arrest of foreign species by cleaving a single phosphodiester bond in the anticodon stem loop of specific tRNAs. Any structure function analysis on ACNases has so far evaded us for two reasons: 1) these toxins are sui generis and lack similarity in primary structure to any known nucleases, 2) there are no known three dimensional structures of any eukaryal ACNase. To that end, I crystallized and solved the structure of an ACNase from *Pichia acaciae* at 1.8 [Angstrom] resolution. The structure of *Pichia acaciae* toxin (PaT) reveals a novel three-dimensional fold with unique topology. Further, using an in vivo yeast growth arrest assay and an in vitro anticodon stem-loop cleavage assay, I have been able to define the enzyme active site, and elucidate the mechanism of action of this unique class of RNA damage proteins.
