This second edition of the successful Handbook of Adhesion provides concise and authoritative articles covering many aspects of the science and technology associated with adhesion and adhesives. It is intended

to fill a gap between the necessarily simplified treatment of the student textbook and the full and thorough treatment of the research monograph and review article. The articles are structured in such a way, with internal cross-referencing and external literature references, that the reader can build up a broader and deeper understanding, as their needs require. This second edition includes many new articles covering developments which have risen in prominence in the

intervening years, such as scanning probe techniques, the surface forces apparatus and the relation between adhesion and fractal surfaces.

Advances in understanding polymer - polymer interdiffusion are reflected in articles drawing out the implications for adhesive bonding. In addition, articles derived from the earlier edition have been revised and updated where needed.

Throughout the book there is a renewed emphasis on

environmental implications of the use of adhesives and sealants. The scope of the Handbook, which features nearly 250 articles from over 60 authors, includes the background science - physics, chemistry and material science - and engineering, and also aspects of adhesion relevant to the use of adhesives, including topics such as: Sealants and mastics Paints and coatings Printing and composite materials Welding and autohesion Engineering design The

Handbook of Adhesion is intended for scientists and engineers in both academia and industry, requiring an understanding of the various facets of adhesion.

Over the last decade, or so, the growth in the use of adhesives, especially in ever more technically demanding applications, has been rapid and many major developments in the technology of adhesives have been reported. This growth has

also led to attention being focused on somewhat more basic studies of the science of adhesion and adhesives, and in recent years our level of fundamental knowledge concerning the formation and mechanical performance of adhesive joints has increased dramatically. Such studies have, of course, been aided greatly by the development of the tools at the disposal of the investigators. For example, specific surface analytical techniques, such as X-ray

photoelectron and secondary-ion mass spectroscopy, and the increasingly sophisticated methods of stress analysis and fracture mechanics have been put to good use in furthering our understanding of the science of adhesion and adhesives. The present book attempts to review the multidisciplinary subject of adhesion and adhesives, considering both the science and technology involved in the formation and mechanical performance of adhesive joints. The author would

like to thank his friends and colleagues for useful discussions and help in the preparation of this book. I am particularly grateful to P. Cawley, J. Comyn, W. A. Lees, A. C. Roulin-Moloney, W. C. Wake, J. G. Williams and R. J. Young who have read and commented on various chapters and P. Farr for preparing the diagrams.

TECHNOLOGY TRANSFER

John Wiley & Sons
Twenty-five years is a considerable time span in

the life of any scientific discipline; certainly in this twentieth century when development is so rapid. For the science of adhesion and the technology of adhesives this is particularly true. For these, the immediately past quarter century might be compared with the Renaissance when all the civilised world was alight with the 'new learning'. Certainly it has been a period of immense advance both of understanding and of application in this an~a of

scientific endeavour. It was in the light of this situation that here at City University we set about arranging the Twenty-fifth Annual Conference on Adhesion and Adhesives, of which this volume presents the proceedings. A total of seventeen papers from seven countries, covering a span of topics from organic chemistry through physical chemistry and physics to engineering. Truly this Conference has 'come of age' and is acknowledged as the annual international

venue for the consideration of adhesion in all its diversity. It is our earnest hope and intention that it shall continue for many more years. May I express my personal gratitude to all those who make the event possible; the audiences as well as the speakers, all those in the University who help in various ways, and the publishers who make it possible for you, the wider audience, to have these proceedings.

This Festschrift documents the Proceedings of the First International Congress on Adhesion Science and Technology, held in honor of Dr. Kash Mittal on the occasion of his 50 birthday, in Amsterdam, The Netherlands, October 16-20, 1995. It contains the full accounts of the plenary and invited lectures, which are divided into the following

seven parts: Part 1: Fundamental aspects of adhesion and general topics; Part 2: Contact angle, wettability and surface energetics; Part 3: Surface modification: Relevance to adhesion; Part 4: Adhesives and adhesive joints; Part 5: Adhesion aspects of polymeric coatings, and polymer-polymer interphase; Part 6: Metal-polymer and metal-ceramic adhesion; and Part 7: General papers. The topics covered include many different aspects of adhesion

science and technology, and both fundamental and applied issues are addressed. The final section of this volume gives a listing of titles, authors and affiliations of the other 185 papers which were included in the technical program of the conference.

Coatings are tested to confirm compliance with specifications, to monitor the operation of a coating process, and to evaluate coatings for various services. The ability of a coating to perform as intended usually depends on several characteristics, and the testing of a coating usually involves several different tests. At first glance the nature of a characteristic that is being tested may seem

clear and the results of a test may seem to be unambiguous, however, the nature of a characteristic may be more complex than realized and the ability of a test to measure the characteristic may be less than expected. The members of the ASTM Committee B-8 on Metallic and Inorganic Coatings felt it was desirable to organize a symposium on the testing of the metallic and inorganic coatings so as to bring these problems to the attention of practitioners. This

publication is based on the symposium, which was presented in Chicago on April 14 and 15, 1986. AIAA/ASME 18th Structural Dynamics & Materials Conference, San Diego, Calif., March 21-23, 1977 William Andrew Vols. for 1970-71 includes manufacturers' catalogs.

 Surface Preparation Techniques for Adhesive Bonding is an essential guide for materials scientists, mechanical engineers, plastics engineers, scientists and researchers in manufacturing environments making use of adhesives technology. Wegman and van Twisk provide practical

coverage of a topic that receives only cursory treatment in more general books on adhesives, making this book essential reading for adhesion specialists, plastics engineers, and a wide range of engineers and scientists working in sectors where adhesion is an important technology, e.g. automotive / aerospace, medical devices, electronics. Wegman and van Twisk provide a wealth of practical information on the processing of substrate surfaces prior to

adhesive bonding. The processing of aluminum and its alloys, titanium and its alloys, steels, copper and its alloys, and magnesium are treated in the form of detailed specifications with comparative data. Other metals not requiring extensive treatment are also covered in detail, as are metal matrix and organic matrix composites, thermosets and thermoplastics. This new edition has been updated with coverage of the latest developments in the field including the

sol-gel process for aluminum, titanium, and stainless steel, atmospheric plasma treatment for metals, plastics and rubbers and treatments for bronze and nickel alloys. This event was cosponsored by the Dielectric and Insulation,

and Electrothermics and Metallurgy Divisions. Polymeric coatings are used for a number of purposes, e. g. , decorative, protective, functional (as dielectrics or insulators) and a special application of polymeric (organic) coatings is their use as lithographic materials for making integrated circuit elements. Irrespective of the purpose of the coating, it must adhere well to the underlying substrate. So the need to understand the factors which influence adhesion

of organic coatings and the ways to attain desired adhesion is quite manifest. This Symposium was designed to bring together scientists and technologists interested in the adhesion aspects of polymeric coatings, to provide a forum for discussion of latest findings, and to provide an opportunity for cross-pollination of ideas. The technical program contained a total of 46 papers by authors from various corners of the world. The program comprised both invited

overviews and contributed original research papers, as this blend is the best way to present the state of knowledge of a topic. The invited speakers were selected so as to represent widely differing disciplines and interests and they hailed from various academic and industrial research laboratories.
