 The Corps of Engineers (CE) Test
 Procedures document has been prepared
 in a format similar to the referenced MIL-

STD-705B test methods to provide for
 easy implementation by CE district and
 division personnel. The procedures
 provide for acceptance testing large
 diesel engine-generator sets--up to 6000
 kW capacity range--intended for
 installation in fixed military facilities as
 Class A (Prime), Class B (Standby), or
 Class C (Emergency) electrical power
 generation sources. This document
 provides a list of MIL-STD-705B test
 methods which are directly applicable
 for acceptance testing large diesel
 engine-generator sets. In addition, the
 document provides new test procedures
 numbered CE-TP-1001 through 1004,
 designed specifically for acceptance
 testing large stationary diesel engine-
 generator sets intended for electrical
 power generation within fixed military

facilities. (Author).

The aim of the Liberty was to standardize aircraft engine design. The theory was to have an engine design that could be built in several sizes and thus power airplanes for any purpose, from training to bombing. The differences in sizes would be obtained by using different numbers of cylinders in the same design. A large number of other parts would also be used in common by all resulting sizes of the engine series. The initial concept called for four-, six-, eight- and 12-cylinder models. An X-24 version was built experimentally, and one- and two-cylinder models were built for testing purposes. The engine design eventually saw use on land, sea, and in the air, and its active military career spanned the years 1917 to 1960. In addition, it

provided noble service in a multitude of civilian uses, and still does even today, some 90 years after the first engine ran. This book covers the complete history of the Liberty's design, production, and use in amazing detail and includes appendices covering contracts, testing, specifications, and much more.
