questions on finding missing sides of similar figures. In geometry two triangles are similar if and only if corresponding angles are congruent and the lengths of corresponding sides are proportional. Finding missing sides of similar figures worksheet Multiplying both sides by 16 gives $(x = 16 \cdot \tan 62^\circ \approx 30.1)$, rounded to the nearest tenth. The value (30.1) was obtained by computing $(16 \cdot \tan 62^\circ)$ in a calculator. MAKE SURE your calculator is in degree mode!!! Example: Find the missing side (x) . Round to the nearest tenth. In this circle, we can see the triangle has a hypotenuse equal to the radius of the circle (r), an angle equal to half the angle made by the chord, and a side that is half the length of the chord. By using the sine function, we can solve for r . The length of the entire chord is twice the length of r , so the entire chord length is $2r$.
